

Tufin for Stormshield Network Security

Executive Summary

Stormshield Network Security (SNS) firewalls protect networks across European government, defense, and critical infrastructure, where ANSSI certification and NIS2 obligations set a high bar for control and audit evidence. Tufin now supports Stormshield SNS firewalls with a fully supported, native integration. Your Stormshield firewalls get the same policy visibility, compliance checks, change tracking, topology, and access request automation as the rest of your network, so one standard applies across your entire estate.

Barriers To Your Success

Many organizations run Stormshield alongside other firewall vendors, cloud security controls, and SASE platforms. Until now, Stormshield firewalls sat outside centralized policy management. They were often connected through unsupported stop-gap plugins or managed entirely by hand, while the rest of the estate followed a standard process.

Organizations commonly struggle with:

- Policy blind spots where Stormshield firewalls sit outside central visibility
- Unmanaged risk from rules that are never checked against compliance policy
- Manual, error-prone change implementation on Stormshield devices
- Audit evidence stitched together by hand for ANSSI- and NIS2-bound environments
- Fragile integrations built on unsupported plugins
- Siloed processes across a mixed-vendor estate

Security and network teams are under constant pressure to respond quickly to auditors and regulators. Every part of the network that sits outside the standard process becomes an exception that someone has to explain, and every manual change adds risk.

How It Works

Tufin Orchestration Suite collects policy and configuration from your Stormshield SNS firewalls and models them alongside your other firewalls, cloud environments, and SASE platforms. The result is a single, end-to-end view of how access is governed across your environment, so you can see, change, and audit Stormshield policy exactly the way you manage the rest of your network.

Stormshield support is available for Tufin Orchestration Suite 5.2 and above. With Tufin Orchestration Suite 5.4, Stormshield rules are also part of the Rule Recertification workflow, so rule owners review them on the same schedule as the rest of your estate.

With Stormshield in Tufin, your team can:

- See every Stormshield rule in one place with centralized policy visibility
- Check Stormshield rules against your compliance policies automatically
- Track every change with full revision history
- Map your network topology and analyze traffic paths end to end
- Automate access requests, with changes designed and verified by Tufin
- Include Stormshield rules in your rule recertification process

Driving Business Outcomes

By bringing Stormshield under centralized policy management, you remove one of the most common gaps in a European security estate. Audits get simpler, changes get safer, and your teams spend less time reconciling separate tools.

Organizations benefit from:

- No more blind spots in mixed-vendor estates
- Less manual audit effort for ANSSI- and NIS2-bound environments
- Faster, more reliable changes with automated design and verification
- A fully supported native integration in place of unsupported plugins
- Consistent compliance and change control across your entire estate

Why Tufin for Stormshield?

Regulators and auditors expect one consistent standard for network security policy, regardless of which vendor protects which part of the network. Tufin gives your Stormshield firewalls the same visibility, compliance, and change control as the firewalls, cloud platforms, and SASE services you already manage, so your evidence is complete and your processes are consistent.

About Tufin

Tufin helps enterprises govern and secure connectivity across today's complex multi-vendor networks. As the leader in network security posture management, Tufin provides the trusted control layer organizations need to understand exposure, automate policy changes safely, and maintain continuous security posture across on-premises, cloud, SASE, microsegmentation, and hybrid environments. Built on customer-proven network automation playbooks and the industry's only Dynamic Network Connectivity Graph, Tufin is bringing Multi-Vendor Agentic Network Security to the enterprise - helping organizations move from visibility to governed, AI-driven action.
